Acknowledgement

The study team would like to express sincere gratitude to the Chairperson of Banganga Municipality Mr. Mangal Prasad Tharu; Vice Chairperson Mr. Chakrapani Aryal; Chief Executive Officer of the Office of Banganga Municipality, Mr. Tekraj Panthi; Elected Members of Municipality Executive Body and the staffs of Banganga Municipality for the valuable co-operation and suggestions that guided us to accomplish the agreed task up to this level.

We are also thankful to the local people and social mobilizers of Banganga Municipality for their help and suggestion in selection and identification of the roads. We hope this ongoing process of preparation of Municipal Transport Master Plan (MTMP) of Banganga Municipality will be very helpful and a valuable guideline for the planning and development of effective and systematic transport network within Banganga Municipality.

The study team.

Scoring Criteria and Prioritization

This section presents detail scoring criteria developed, and approved by the municipality and municipal road coordination committee (MRCC) for prioritization of municipal roads for different interventions during the five year period of municipal transport master plan (MTMP). It also includes the list of prioritized roads and detail budget for the roads for the period of five years.

A network consists of several links. Simply defining, networks are the junction or intersection and link is the distance between the junctions. Each roads has its own importance which may be access to large settlement area, access to market and other services, access to production centres, etc. It is not possible to construct/maintain or upgrade all roads at a time due the constraints of time, resource and budget. The immediate necessity of interventions in different roads cannot be defined superficially based on individual/group perspective as the perspective of people can be biased. Thus, a non-biased comprehensive criteria for prioritization of roads is necessary for scientific allocation of the limited resources. The prioritization should include all the possible criterion that will include all the importance any road linkages may provide. So that all the roads can be weighted based on the criteria and ranked based on the total weightage.

After rigorous study and consultation with municipality and the MRCC, nine criteria has been identified for prioritization of the municipal road linkages. The criteria are- road priority obtained from demand form, hierarchy class of road, existing road width, total population served by the road, road density served by the road, settlement density of the area surrounded by the road, road surface type, sectorial services provided by the road (i.e. for what purpose the road serve, whether it is for agricultural purpose or recreational or service or market) and social equity (provide the access to the minority peoples). All these criteria reflect their relative importance among the roads. The weighted average of score on each criteria that each intervention receives leads to a ranking/prioritization of the intervention options.

Decision on weightage/score of each criterion is one of the complicated task to be performed. After rigorous study and analysis of score corresponding to each criteria, score is presented in front of municipality and MRCC. The score and criteria has been discussed and modified as deemed necessary by the municipality and MRCC. The score of each criteria has been designated such that its value does not create biasness in the final result.

The various criteria and their corresponding weightage/score is summarized in Table 1.

S.N	Scoring Criteria	Scoring Unit	Score
1	Demand Priority of wards		
2	Proposed Road Class		
3	Total existing width	Meter	
4	Population served	Number	
5	Benefit from network in the form of access to recreational centre, agricultural centre, market and services based on demand form		
6	Road Density	Road length per sq. km. and 1000 population	
7	Settlement Density	People per unit usable	
8	Access to poor and minority group	Yes/No	
9	Surface type		

Table 1: Weighted scoring criteria

Each criterion are described in brief below.

Demand priority of wards

It is the one of the major criteria for prioritization. Demand with priority order was collected from each ward during the field surveys. These priority is based on present need as perceived by the locals. Higher the priority of intervention, higher is the score share. That is, if a road intervention received number 1 priority in any ward, then it will get full marks. Road with corresponding priority are scored accordingly; score received is reduced by 20 % for each lower level priority, i.e. second priority road will receive 80% score. Lowest priority (5th priority) link intervention will get 20% of total score. And all other roads will receive 10% of the total score.

Road class based on hierarchy

It is one of the criteria for prioritization. Road hierarchy reflects the importance of the road linkage in the municipality. Higher the road class, high will be the importance of roads and immediate the intervention required. Class D serve at local level whereas Class A road serves in large framework. Class A serves as the access of Class B to D roads and hence it should receive higher rank. Thus while scoring, Class A roads will receive full score and as class of road decreases the score will reduce accordingly by 20%, i.e. Class B will get 80% and Class D will get 40%.

Existing Width

Existing width of the road is also a governing factor for prioritization. The present width of the road is the indicator of the present importance of the road to the locals. The road which is wider among many road within the municipality has higher importance than other roads. Thus, widest road is given highest priority and thus full score. As the new proposed road doesn't have width at present day giving them zero score will not be realistic and thus new proposed road is given 25% of the total score. Road width within zero and maximum width is given score based on relative scoring to the existing roads.

Population served

Population served by the road link is one of the important indicator of prioritization. Higher the population served by the road, higher will be its necessity or importance and thus its need to be constructed/upgraded/maintained first. Thus, highest score is assigned for the road link serving highest population and all other score is based on the relative marking. Thus, the score for road based on population served lies within zero to full score.

Access to service and facilities

It is one of the main governing prioritization indicator as it outlines the specific service provided to the locals. The road link may provide access to recreational (picnic spot, historical place, park, cinema hall, playground), agricultural land, market centre and service centre (schools, health post, governmental offices, etc.). A single road link can serve just a single or more function. The proposed road intervention which serves all four facilities has highest importance and given highest (full) score. If the road link only serve any three function/purpose, the score is reduced to 80% of the total final marks. Similarly, link serving any of the two function receives 60% and the road which serve only a single function receives 40% score.

Settlement density

Settlement density is defined as population per unit usable area (total area minus forest and water bodies' area) is also a criteria for prioritization. This is necessary because population density (population per unit total area) doesn't reflect the actual occupancy of people in certain locality as presence of non-usable land affects the settlement pattern and possible expansion. The road that serve high settlement density requires immediate attention compared to road just serving small settlement density. The one with maximum settlement density receives full score and with the lowest density receives 50% score. All other roads receives relative score in between them.

Road Density

It is expressed either as road length per unit area or road length per 1000 population. Lower the road density, the road network is considered to be less dense and intervention is must in locality of low road density. Relative road density for each ward is calculated by subtracting municipal road density from each ward level road density. Road link intervention is of immediate necessity if the road densities of the link in terms of both population as well as area is small compared to the average municipal value, as lower values signifies lower accessibility.

Social equity

Social equity is also another indicator of road prioritization. Road link that provide the access to the minority peoples (areas inhabited by backward and poor ethnic groups/communities, isolated remote areas) should be given priority. From social equity perspective, the roads that provide access to settlements with large population of minority groups should also be prioritized.

S. N	Criteria	Scoring Unit	Score
1	Link providing service to large settlement areas/population	Population served/km	15-20
2	Link providing service to areas with high potential for agriculture, horticulture, livestock production	Annual production equivalent to NRs/km	5-10
3	Link providing service to existing <ul style="list-style-type: none"> • Commerce and business centres • Market sites (Local haat) • Tourist attraction areas • Areas having agro-based and cottage industries • Other obligatory centres as decided by the municipality 	Estimated annual transaction in these centres equivalent to NRs/km	20-25
4	Link providing service to the existing service centres such as health centres, education centres such as health centres, education centres (schools/ campuses), offices (municipality office Government / office, etc.), communication centres (post office/telephone, etc.)	Population served by these service centres expressed as persons per km per year	15-20
5	Link providing service to the potential growth or service centres identified by the municipality and shown in the Indicative Development Potential Map of the municipality, Waste Management Site	people to be directly benefited by new growth or service centres expressed as persons per km year Anticipated number of	5-15
6	Link providing service to the potential future development sites such as potential town development, land pooling; potential industrial area and or forming ring road to municipality etc. as indicated in the Indicative Development Potential Map of the municipality.	Anticipated annual financial turn-over from developing the sites expressed as NRs./km	10-20
7	Link providing service to the areas recognised by the municipality as areas for special consideration, such as areas inhabited by backward and poor ethnic groups/communities, isolated remote areas, historic sites, sites etc.religious	<ul style="list-style-type: none"> • Very important • Important • Less important 	10-15

S. N	Criteria	Scoring Unit	Score
8	Direct link with another linkage	<ul style="list-style-type: none"> • National Highway • Feeder Road • District Road • Village Road • Airport 	5-10
	Total		135

Table 2: Scoring criteria summary

Municipal Name Coding

The following guidelines from TOR are followed while coding the Municipal roads. Each transport linkage will have a ten digit code unique for a particular linkage.

- First and second digits (number varying from 01 to 77) represent the district.

- Third digit (letter M indicates the Municipality and RM indicates rural municipality.).

- Fourth and fifth digits (number varying from 01 to 99) represent the particular name of municipality in the district.

- Sixth digit (a letter varying from A to D) indicates the class of transport linkage.

- Next three digits (number varying from 001 to 999) represent the particular transport linkage.
